One of the principle features of antistatic materials is that they shield against electrical conductivity due to the additive they possess. Antistatic polyethylene foam materials are easy to identify due to the pink die with which they are fabricated.

This type of packaging is ideal for electronic equipment and an excellent solution for companies that make circuits, mother boards, computers and electronic accessories that can be damaged by an electrical charge.

Just as in the different types of Polyfoam, our antistatic materials are presented in different calibers and densities.

*NOTE: The pink die has no particular property. It is just marketing identification.*
