

Only the best materials
with the latest technology

Polyroll HD contains a higher proportion of polyethylene resulting in a more closed cell and a higher mechanical resistance. These rolls can be transformed at low costs and due to their roll presentation they can be optimized for performance.

Advantages:

- Rolls of 3.3pcf, 4.2pcf, and 6.5pcf are fabricated in different calibers
- Ideal for packaging products that require a high resistance to compression
- Planks are made from these rolls to support heavy weight products where needed
- Used in the construction industry to fabricate expansion junctions and insulate basements as well as pipes exposed outdoors

These rolls are very versatile because they can be transformed with very low costs and thanks to its presentation in roll, its performance is optimal.
